# ONLINE LAB: Configuring Azure Key Vault Using Portal / PowerShell

# Your Challenge

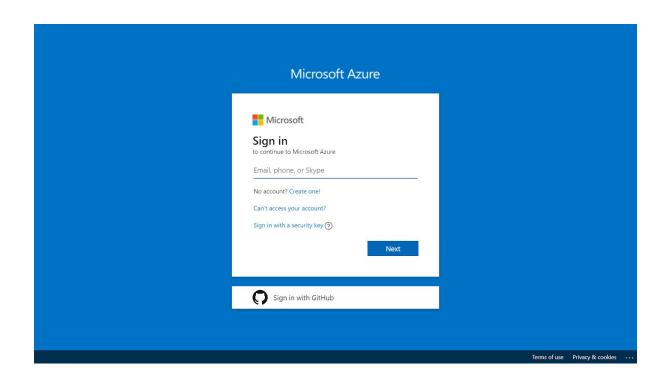

- Create a resource group named **keyvaultgrp** (Portal) / **keyvaultpsgrp** (PowerShell).
- Create a new Key Vault with a unique name in that group.
- Add a secret to that vault, with the key and value of whatever you wish.
- Manage secret in the key vault.
- Clean up all of your resources created after you're done.

## Solution

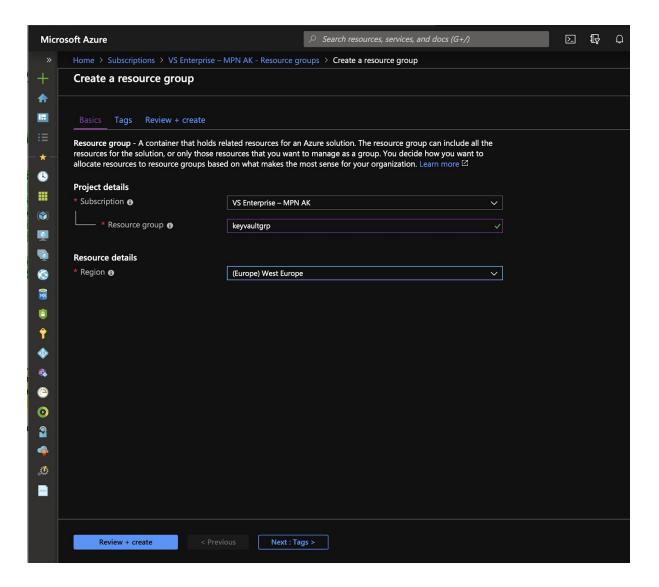

**OPTION 1: Portal** 

Step 1 Sign Into Azure

Sign into Azure at <a href="https://portal.azure.com/">https://portal.azure.com/</a>

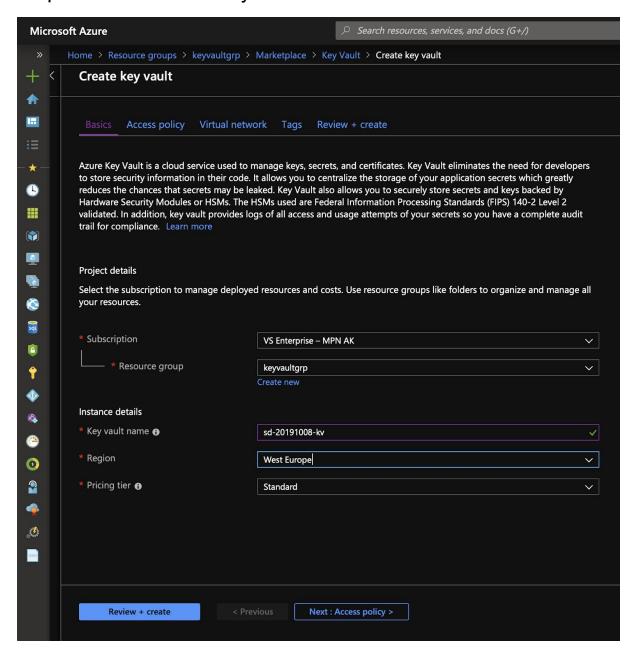

Step 2 Create a resource group

- 1. In the navigation list, click Resource groups.
- 2. Click **Add** to open the **Resource group** blade.
- 3. For Resource group name, enter keyvaultgrp.
- 4. Select a subscription and a location.
- 5. Click **Review + Create** to proceed to the last step.
- 6. Click **Create** to create the resource group.
- 7. Click **Refresh** to refresh the list of resource groups.

The new resource group appears in your resource groups list.

## Step 3 Create Azure Key Vault

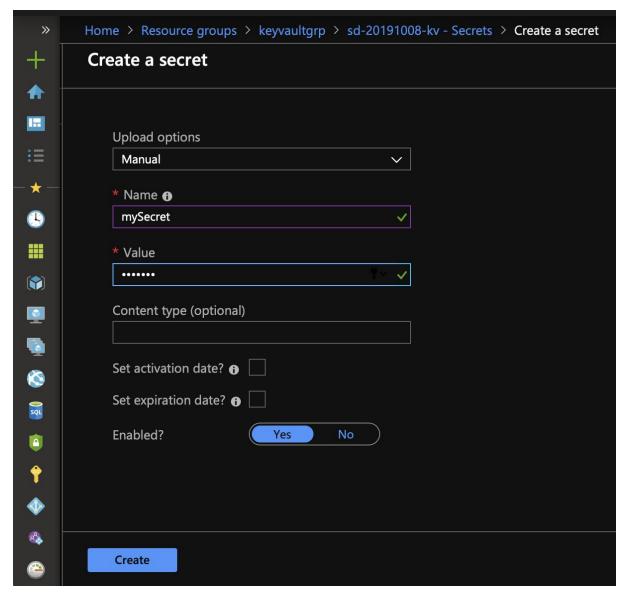

- 1. In the list of Resource groups, click the new **keyvaultgrp** resource group.
- 2. Click **Add** to open the Azure Marketplace.
- 3. Enter "key vault" in the search box and choose Key Vault as a result.
- 4. Click Create.
- 5. Choose the **keyvaultgrp** from the resource group drop down.
- 6. Give the key vault a unique name that cannot be already selected by anyone else in Azure. It must have between 3 and 24 characters, for example: sd-20191008-kv, which follows the pattern: [YourInitials]-[date]-kv.

- 7. Choose the same subscription and location as the resource group.
- 8. Choose Standard Pricing tier.
- 9. Click **Review + Create** to proceed to the last step.
- 10. Click **Create** to create the storage account.
- 11. Wait for the deployment to complete. It should take 30 seconds or so.

The new key vault appears in your resource group.

#### Step 4 Add secret to the vault

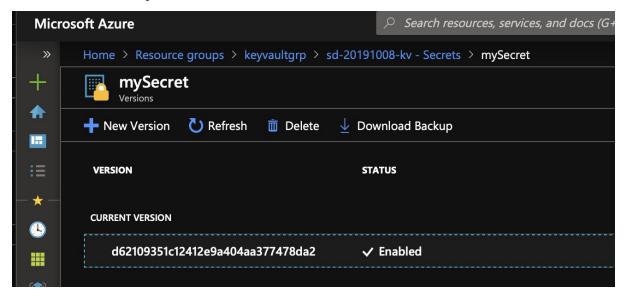

- 1. In the list of Resource groups, click the new **keyvaultgrp** resource group.
- 2. Choose the key vault created in the last step, with the unique name that you gave it.
- 3. In the settings menu on the left, navigate to the "Secrets" menu.
- 4. Select "Generate/Import" from the menu.
- 5. Leave "Manual" as upload options.

- 6. Enter "mySecret" as the name.
- 7. Enter "myValue" as the value.
- 8. Leave the other options with default / no values.
- 9. Click Create to create the secret.

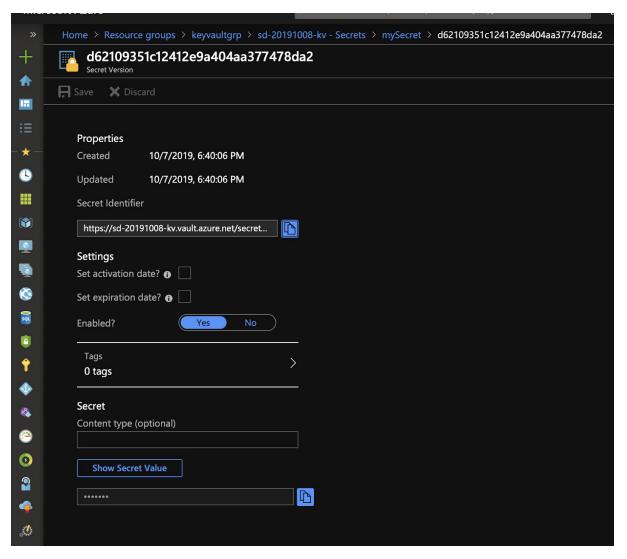

The new created secret should be listed on the secrets lists.

#### Step 5 Manage secret in the vault

- 1. In the list of Resource groups, click the new **keyvaultgrp** resource group.
- 2. Choose the key vault created in the last step, with the unique name that you gave it.
- 3. In the settings menu on the left, navigate to the "Secrets" menu.
- 4. Select the "mySecret" from the list.

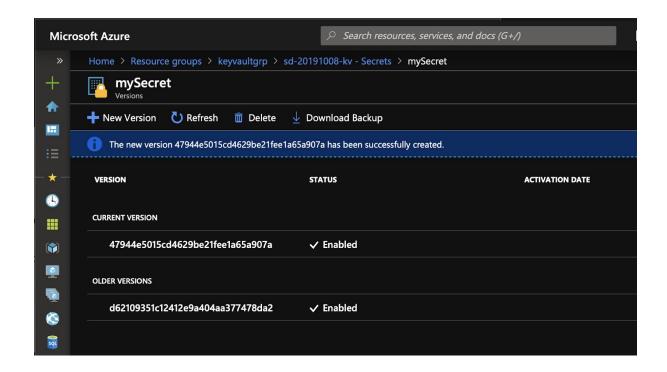

5. From that page you can view the value and properties of the secret by clicking the hash of the desired version:

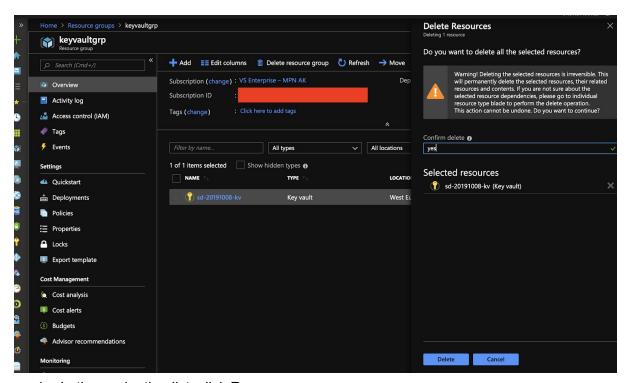

It contains the URL for the secret identifier.

- 6. Or create new version by clicking "**New Version**" button. The portal shows the same UI as in the previous step.
- 7. Specify "myValue2" as the value.
- 8. Leave the other options with default / no values.
- 9. Click Create to create the secret.

The new created secret value should be listed on versions list of the "mySecret".

## Step 6 Clean up

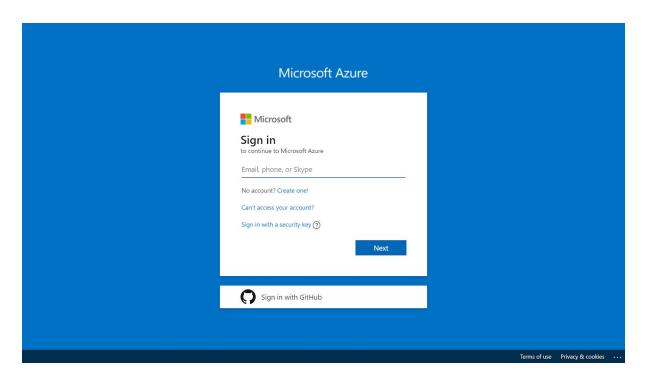

- 1. In the navigation list, click **Resource groups**.
- 2. Click keyvaultgrp to open the resource group.
- 3. Click **Delete resource group** to delete the resource group.
- 4. On the **Are you sure you want to delete** blade, type the resource group name: **keyvaultgrp**.

5. Click **Delete** to delete the resource group.

# **OPTION 2: PowerShell**

## Step 1 Sign Into Azure Cloud Shell

1. Sign into Azure at <a href="https://portal.azure.com/">https://portal.azure.com/</a>

2. On the main menu, click on the Cloud Shell icon.

Or navigate to <a href="https://shell.azure.com">https://shell.azure.com</a>.

#### Step 2 Create a resource group

- 1. If your account has access to multiple subscription, please select the appropriate subscription by:
  - a. Listing the subscriptions for which your account has access:

Get-AzSubscription

b. Selecting the desired subscription:

Select-AzSubscription -Subscription "[YourSubscriptionNameOrId]"

2. Create the **Resource group** with given name **keyvaultpsgrp** and desired location, like **westeurope**, by executing the command:

```
$location = "WestEurope"
$rgName = "keyvaultpsgrp"
New-AzResourceGroup -Name $rgName -Location $location
```

3. You should get the following output of the above command:

```
Azure:/
PS Azure:\> $location = "WestEurope"
Azure:/
PS Azure:\> $rgName = "keyvaultpsgrp"
Azure:/
PS Azure:\> New-AzResourceGroup -Name $rgName -Location $location

ResourceGroupName : keyvaultpsgrp
Location : westeurope
ProvisioningState : Succeeded
Tags :
ResourceId : /subscriptions/!

/resourceGroups/keyvaultpsgrp
```

The new resource group appears in your resource groups list or when executing the command:

```
Get-AzResourceGroup
```

## Step 3 Create Azure Key Vault

1. In the previously created resource group "keyvaultpsgrp", create key vault with a unique name that cannot be already selected by anyone else in Azure. It must have between 3 and 24 characters, for example: sd-20191008-ps-kv, which follows the pattern: [YourInitials]-[date]-ps-kv, by executing the command:

```
$vaultName = "sd-20191008-ps-kv"
New-AzKeyVault -Name $vaultName -ResourceGroupName $rgName -Location
$location
```

You should get the following output of the above command:

```
PS Azure: \> New-AzKeyVault -Name $vaultName -ResourceGroupName "keyvaultpsgrp" -Location $location
                                                 : sd-20191008-ps-kv
Resource Group Name
Location
Resource ID
                                                 : keyvaultpsgrp
: WestEurope
                                                 //subscriptions/
rosoft.KeyVault/vaults/sd-20191008-ps-kv
thtps://sd-20191008-ps-kv.vault.azure.net/
                                                                                                                                /resourceGroups/keyvaultpsgrp/providers/Mic
Vault URI
Tenant ID
                                                    Standard
Enabled For Deployment?
Enabled For Template Deployment?
Enabled For Disk Encryption?
Soft Delete Enabled?
                                                    False
Access Policies
                                                    Default Action
                                                                                                                     : Allow
                                                                                                                     : AzureServices
                                                    Virtual Network Rules
Tags
WARNING: Access policy is not set. No user or application have access permission to use this vault. This can happen if the vault was created by a service principal. Please use Set-AzKeyVaultAccessPolicy to set access policies.
PS Azure:\>
```

- 2. In order to manage secrets, you have to add Access Policy to yourself.
  - a. Find the Azure AD corresponding to your name:

```
Get-AzADUser -StartsWith "[YourName]"
```

b. Select the user:

```
$adUser = Get-AzAdUser -UserPrincipalName "[YourUserPincipalName]"
$adObjectId = $adUser.Id
Set-AzKeyVaultAccessPolicy -VaultName $vaultName -ResourceGroupName
$rgName -ObjectId $adObjectId -PermissionsToSecrets get, list, set
```

3. The new key vault group appears in your resource group "**keyvaultpsgrp**" or when executing the command:

```
Get-AzKeyVault -ResourceGroupName $rgName
```

## Step 4 Add secret to the vault

 In order to add "mySecret" secret with the "myValue" as the value, type the command:

```
$secretName = "mySecret"

$secretValue = ConvertTo-SecureString -String "myValue" -AsPlainText
-Force

Set-AzKeyVaultSecret -VaultName $vaultName -Name $secretName -SecretValue
$secretValue
```

2. The output of the command should be like:

```
PS Azure:\> $secretName = "mySecret"
Azure:/
PS Azure:\> $secretValue = ConvertTo-SecureString -String "myValue" -AsPlainText -Force
Azure:/
PS Azure:\> Set-AzKeyVaultSecret -VaultName $vaultName -Name $secretName -SecretValue $secretValue

Vault Name : sd-20191008-ps-kv
Name : mySecret
Version : 6396867e08164a73aaca2900738c905e
Id : https://sd-20191008-ps-kv.vault.azure.net:443/secrets/mySecret/6396867e08164a73aaca2900738c905e

```

The new created secret should be listed on the secrets lists or by executing command:

```
Get-AzKeyVaultSecret -VaultName $vaultName
```

## Step 5 Manage secret in the vault

1. In order to list the versions of the "mySecret" secret, execute the command:

```
Get-AzKeyVaultSecret -VaultName $vaultName -Name $secretName -IncludeVersions
```

2. To add "myValue2" as the second version of the "mySecret" secret, type:

```
$secretValue2 = ConvertTo-SecureString -String "myValue2" -AsPlainText
-Force
Set-AzKeyVaultSecret -VaultName $vaultName -Name $secretName -SecretValue
$secretValue2
```

3. And the first command of this step will return now two versions:

```
PS Azure:\> Get-AzKeyVaultSecret -VaultName $vaultName -Name $secretName -IncludeVersions
Vault Name : sd-20191008-ps-kv
Name
Version
Id
                : e94dac6885a0495ebfbbccdb49fd860b

## Step 6 Clean up

1. Using the Cloud Shell delete the "keyvaultpsgrp" resource group:

Remove-AzResourceGroup -ResourceGroupName \$rgName

2. Confirm by typing [Y] Yes.

```
PS Azure:\> Remove-AzResourceGroup -ResourceGroupName $rgName

Confirm

Are you sure you want to remove resource group 'keyvaultpsgrp'

[Y] Yes [N] No [S] Suspend [?] Help (default is "Y"): Y

True

Azure:\>

PS Azure:\>
```
